

# Principles of Programming Languages

## Small examination

Student ID:

Name:

**Problem 1** Illustrate the quilts represented by the following expressions (1), (2), and (3) in the language Little Quilt.

(1) `sew (turn (turn (b)), a)`

(2) `let`  
    `val x = turn (b)`  
    `in`  
        `sew (x,x)`  
    `end`

(3) `let`  
    `fun unturn (x) = turn (turn (turn (x)))`  
    `fun pile (x,y) = unturn (sew (turn (y), turn (x)))`  
    `val aa = pile (a, turn (turn (a)))`  
    `val bb = pile (unturn (b), turn (b))`  
    `in`  
        `sew (aa, bb)`  
    `end`

The meaning of `a`, `b`, `turn`, `sew` are as follows. The other constructs of Little Quilt (`let` expressions, `val` declaration, `fun` declaration) have the meaning explained in the lecture.

- Expressions `a` and `b` represent the quilts in Figure 1 and Figure 2 respectively.

Figure 1: The quilt that `a` represents

Figure 2: The quilt that `b` represents

- The expression `turn (e)` represents the quilt obtained by rotating 90 degrees to the right the quilt represented by the expression `e`.
- The expression `sew (e1, e2)` represents the quilt that is obtained by sewing the two quilts `e1` and `e2`, where `e1` is in the left side and `e2` is in the right side, and they must have the same height.

**Problem 2** Answer the following problems about the control flow in the imperative language presented in the lecture.

(1) Illustrate the control flow of the following program fragment.

```
if x>0 then x := x - 1
else if y>0 then y := y - 1
      else y := y + 1
```

(2) Illustrate the control flow of the following program fragment.

```
while x>0 do
  begin
    if x=3 then
      begin
        x := x - 1;
        continue
      end;
    y := y + 1;
    x := x - 1
  end
```

### Problem 3

Derive the Hoare triples (1), (2), and (3) by using the rules presented in the lecture.

(1)  $\{a = 3\} a := a + 1 \{a = 4\}$

(2)  $\{a = 3\} a := a + 1; a := a + 2 \{a = 6\}$

(3)  $\{x = 5\} \textbf{while } x > 0 \textbf{ do } x := x - 1 \{x = 0\}$

#### Problem 4

Show the output produced by executing the following Pascal program. When the keyword `var` is attached to a formal parameter, it designates the parameter as call-by-reference. The procedure `writeln` writes out to the standard output the value of the parameter and a new line character.

```
program test;                                begin
var x : integer;                            x := 3;
var y : integer;                            y := 4;
procedure swap                               swap (x,y);
  (var x: integer;                          writeln (x);
   var y : integer);                       writeln (y)
var z : integer;                            end.
begin
  z := x; x := y; y := z
end;
```

#### Problem 5

Show the output produced by executing the following Pascal program. Note that Pascal is statically (lexically) scoped.

```
program P;      procedure D;      begin
var n : char;   var n : char;      n := 'L';
procedure W;    begin              W;
begin           n := 'D';          D
  writeln(n)    W                  end.
end;            end;
```

#### Problem 6

Show the meaning of the following programs (1) and (2) by using the rules presented in the lecture. Note that the programs are in the small subset of C presented in the lecture. Let the states before executing the programs both to be  $\sigma = \{(X, 3), (Y, 1), (Z, 0)\}$ .

(1) 2

(2) ((2+3)\*X)

## Rules presented in the lecture

### Hoare logic

$$\begin{array}{c}
 \frac{\{P\} S_1 \{Q\} \quad \{Q\} S_2 \{R\}}{\{P\} S_1; S_2 \{R\}} \text{ (composition rule)} \\
 \frac{\{P \wedge E\} S_1 \{Q\} \quad \{P \wedge \neg E\} S_2 \{Q\}}{\{P\} \text{ if } E \text{ then } S_1 \text{ else } S_2 \{Q\}} \text{ (conditional rule)} \\
 \frac{\{P \wedge E\} S \{P\}}{\{P\} \text{ while } E \text{ do } S \{P \wedge \neg E\}} \text{ (while rule)} \\
 \{Q[E/x]\} x := E \{Q\} \text{ (assignment axiom)} \\
 \frac{P \Rightarrow P' \quad \{P'\} S \{Q'\} \quad Q' \Rightarrow Q}{\{P\} S \{Q\}} \text{ (consequence rule)}
 \end{array}$$

### Operational semantics for the small subset of C

- Rules for arithmetic expressions

- Sequences of numbers:  $\langle n, \sigma \rangle \rightarrow m$  where  $m$  is an integer represented by the sequence of numbers  $n$  in the decimal representation.
- Variables:  $\langle x, \sigma \rangle \rightarrow \sigma(x)$
- Addition:

$$\frac{\langle a_1, \sigma \rangle \rightarrow m_1 \quad \langle a_2, \sigma \rangle \rightarrow m_2}{\langle (a_1 + a_2), \sigma \rangle \rightarrow m} \text{ (} m \text{ is the sum of } m_1 \text{ and } m_2 \text{.)}$$

- Subtraction:

$$\frac{\langle a_1, \sigma \rangle \rightarrow m_1 \quad \langle a_2, \sigma \rangle \rightarrow m_2}{\langle (a_1 - a_2), \sigma \rangle \rightarrow m} \text{ (} m \text{ is the difference of } m_1 \text{ and } m_2 \text{.)}$$

- Multiplication:

$$\frac{\langle a_1, \sigma \rangle \rightarrow m_1 \quad \langle a_2, \sigma \rangle \rightarrow m_2}{\langle (a_1 * a_2), \sigma \rangle \rightarrow m} \text{ (} m \text{ is the product of } m_1 \text{ and } m_2 \text{.)}$$

- Rules for statements

- Assignments:

$$\frac{\langle a, \sigma \rangle \rightarrow m}{\langle x = a; , \sigma \rangle \rightarrow \sigma[m/x]}$$

where  $\sigma[m/x]$  is defined as follows.

$$(\sigma[m/x])(y) = \begin{cases} m & \text{if } y = x \\ \sigma(y) & \text{if } y \neq x \end{cases}$$

- Sequences:

$$\frac{\langle c_1, \sigma \rangle \rightarrow \sigma_1 \quad \langle c_2, \sigma_1 \rangle \rightarrow \sigma_2}{\langle c_1 \ c_2, \sigma \rangle \rightarrow \sigma_2}$$

- while** statements:

$$\frac{\frac{\langle a, \sigma \rangle \rightarrow 0}{\langle \text{while } (a) \{c\}, \sigma \rangle \rightarrow \sigma} \quad \langle a, \sigma \rangle \rightarrow m \quad \langle c, \sigma \rangle \rightarrow \sigma_1 \quad \langle \text{while } (a) \{c\}, \sigma_1 \rangle \rightarrow \sigma_2}{\langle \text{while } (a) \{c\}, \sigma \rangle \rightarrow \sigma_2} \text{ (if } m \neq 0 \text{)}$$
